Enabling the right solutions...

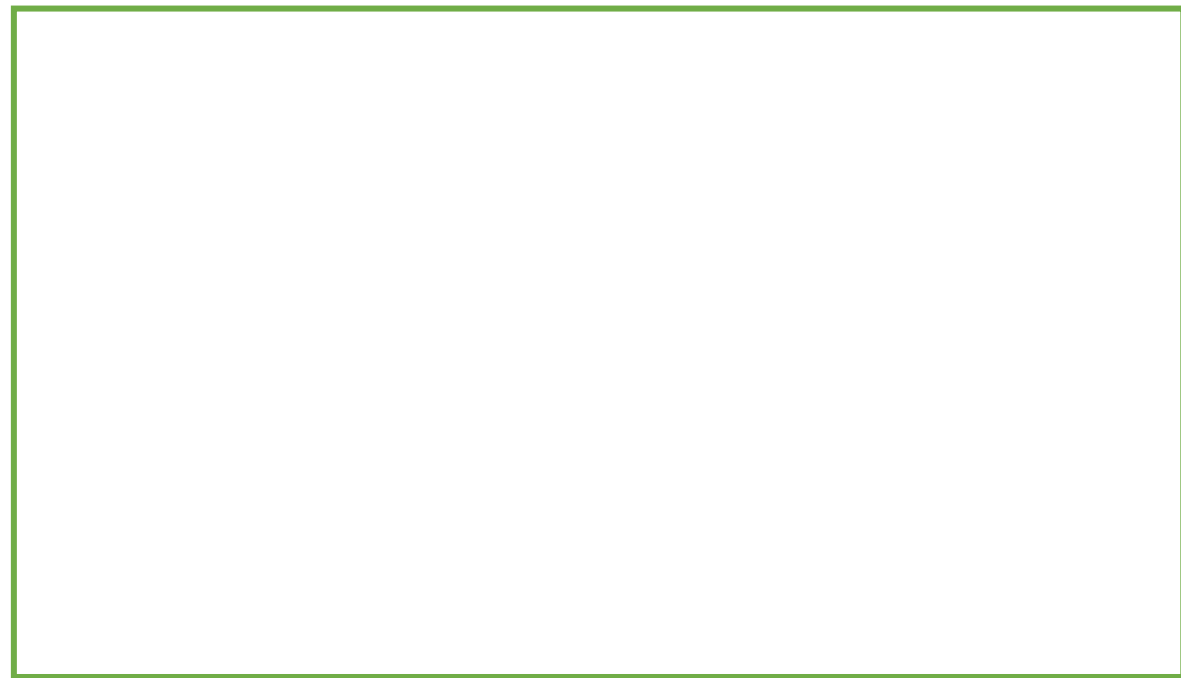

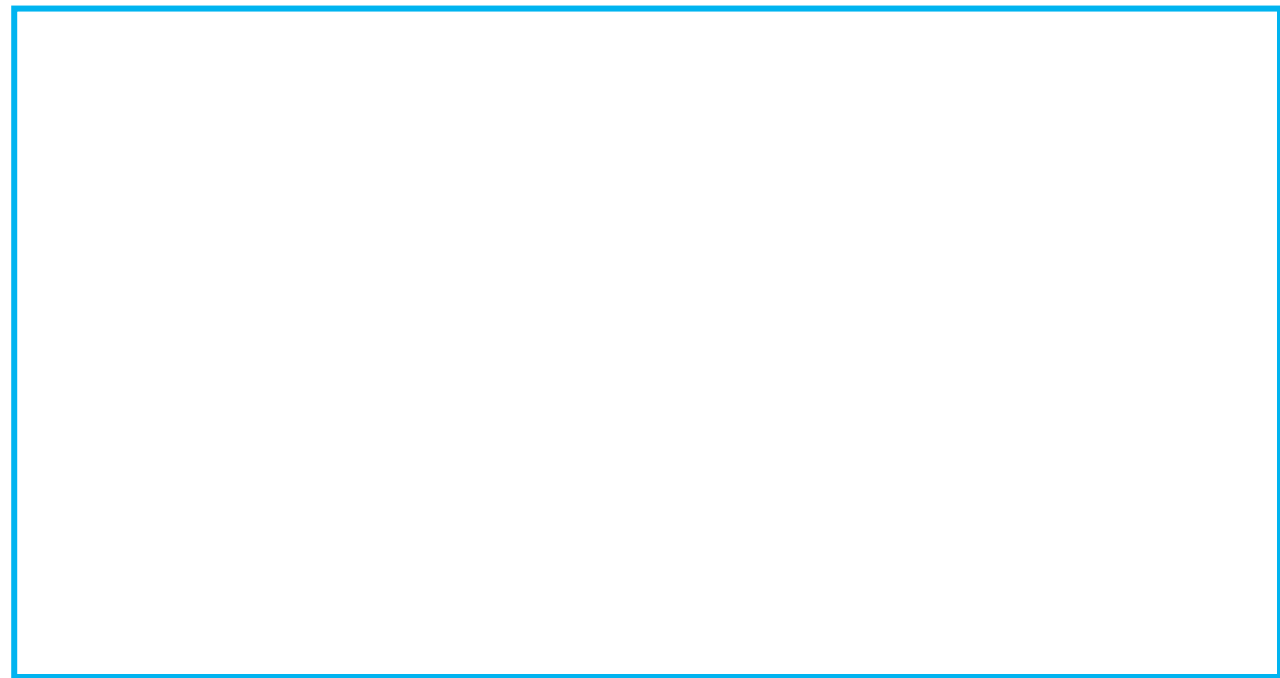

...by having **legislation** that supports the following 2 principles

1. Surface water should be kept separate from foul water
2. Surface water should be returned to the environment as close as possible to where it lands

In other words legislation needs to....

- A. Reduce volume of surface water continually being added
- B. Make it easier to remove and dispose of surface water
- C. Make it easier to tackle groundwater – keep it out
- D. Improve probability of sewer capacity not being compromised

Currently it doesn't:
