Multiple Indices of Deprivation

Indices of multiple deprivation (IMD) are datasets used within the UK to classify the relative deprivation (a measure of poverty) of small areas. Multiple components of deprivation are weighted with different strengths and compiled into a single score of deprivation.

The most deprived areas are ranked 1, least ranked 10. These have been used as a mapping base and for each play area to determine relative importance and impact of the play space for residents.

Total no. of defects

Figures are taken from the annual Inspection data for June 2023, compiled by an independent specialist supplier.

Play Life Expectancy Average (Yrs)

Taken from annual inspection data, assessing likely life span remaining for individual assets.

Play Audit Score (highest possible score 53)

Site audits undertaken by Council green spaces team, assessing a range of factors that make up the quality of the space, such as access, trees, planting and vegetation, setting, proximity to a café/toilets etc. All play sites were visited by 2 people and a site audit undertaken and a score generated across categories.

Total Score / Total Score Ranking

Multiplying the various factors (population, IMD, audit and life expectancy scores) to generate an overall score and a ranking of each facility. This creates a prioritised and balanced assessment of each facility and is taken in to the Improvement Plan to rank the priority for changes.
